

The Observatory of frailty situations

Objectives

Identifying difficulties for retirees to access rights, care and prevention systems. The identification is based on retirement and health data, gathered from all retirement schemes (Carsat-MSA-RSI-CPAM).

- ✓ Identifying seniors at risk of social frailty and propose local adapted service offers (health and retirement)
- ✓ Identifying the priority territories in order to implement preventive actions
- ✓ Evaluating the impact of preventive actions: beneficiaries' profiles, monitoring of cohorts
- ✓ Researching and experimenting on detection of frailty risks, in cooperation with partners.

Carried out work

► Implementation of a Geographical Information System « Grand Sud »

This GIS enables:

- Consulting primary territories of intervention within the field of ageing risks prevention
- Visualising available collective prevention actions
- Establishing a territorial diagnosis by cross-referencing different indicators.

The concept of territorial frailty was defined on the basis of a composite indicator which takes into account economical risk factors linked to social seclusion risks (welfare pension scheme, low income excluding the payment of state taxes, widowhood)

The majority of indicators are taken from the databases of the Carsat, the other retirement schemes (MSA – RSI) and the Health Agencies network (CPAM – DRSM).

Offers of collective actions in preventing ageing risks are implemented or financed by the pension schemes.

Visit the GIS on the Carsat Languedoc-Roussillon website. Tutorials are also available online.

► Regional Atlas 2012

The Frailty Regional Atlas presents the primary territories for intervention on a regional scale, on which young seniors (55-74 years) retired under the main retirement scheme present frailty risk factors.

Visit the Regional Atlas 2012 on the Carsat Languedoc-Roussillon website.

► Frailty situations National Atlas, 2014

The Frailty situations national Atlas illustrates how the Retirement and health branches utilise the Observatory initiative in order to adjust service offers to localised needs.

Made of regional and national contributions, the Atlas enables accurate realisations on ageing risks prevention.

The regional diagnosis (all retirement schemes) in the Languedoc-Roussillon Region (LR) as well as regional actions, have been integrated in the Atlas to illustrate the broadening of the Observatory to all retirement schemes.

Prospects

- ▶ Elaboration of national cartographies which can be consulted through SIGs.
- ▶ Multi-criteria analysis on elderly frailty through the experiment of cross-referencing the data of Health and Retirement insurances.
- ▶ Analysis of populations in renouncement of care through the Carsat' service offer « Newly retired at risk of frailty »
